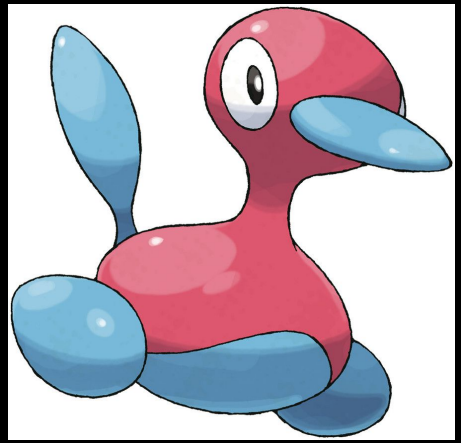
SLOT MACHINE

PORYGON12

4.22.26

LET’S WASTE SOME WATER



Research

Domain

Modern machine layouts and themes

Scoring via reels, paylines, multipliers, and bonus rounds

Feedback via lights, SFX, and animations

Engineering

Reel spin times and staggered animation

Counting animations on wins, not losses

Tiered win feedback

Reduced motion settings

AI and Workflow

PRD-driven iteration, each item is one context window

Verification step so the agent re-reads its work

Test case formatting

Setup

Model Used:
Gemini Flash Preview 3 CLI

23 iterative prompts

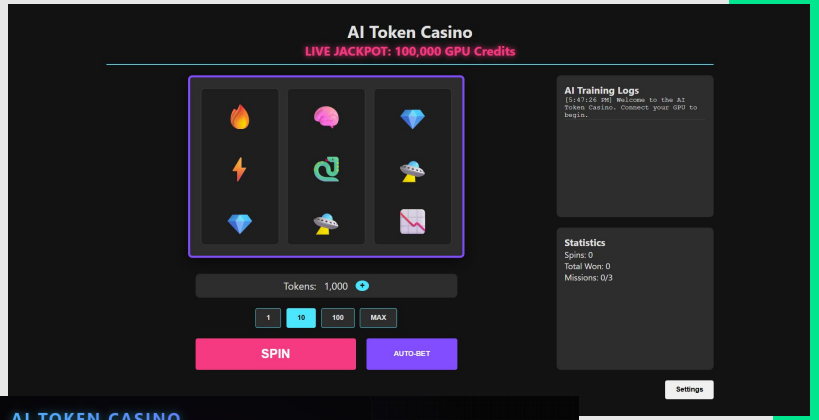
Minimal manual code editing

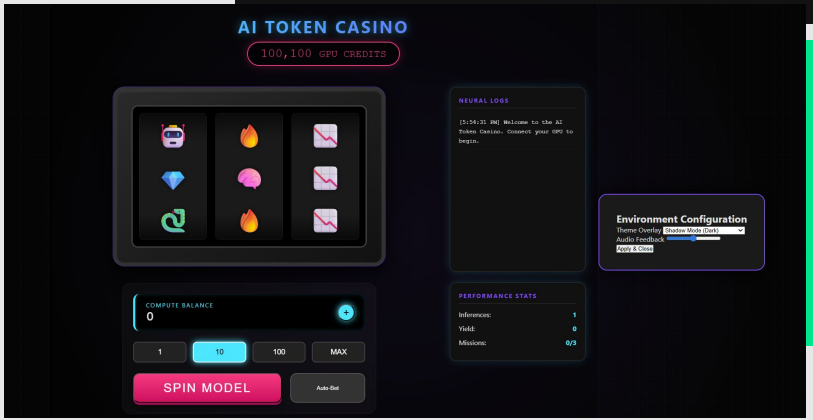
Start simple, add more features later

Follow clean code principles

2 main personas: Karen and Gary

Development





It. 1: Initial Build

Project setup, added main files, built basic gameplay features

Issues: unpolished, lack of features

It. 2: Stability and Code Quality

Fixed bugs, improve token handling and auto-bet feature

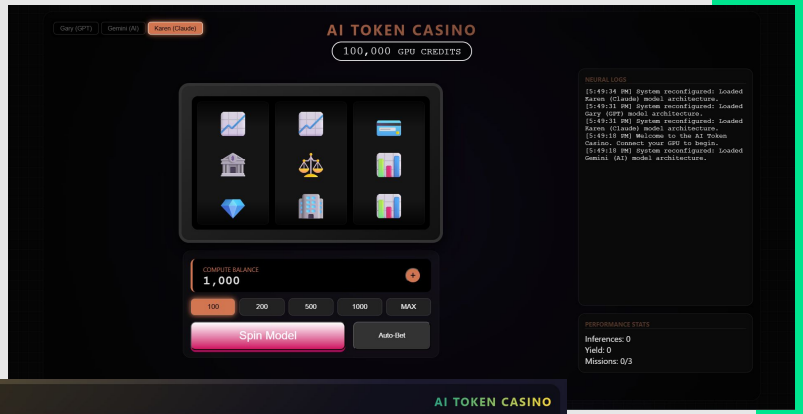
Asked AI to improve linting, documentation, and structure

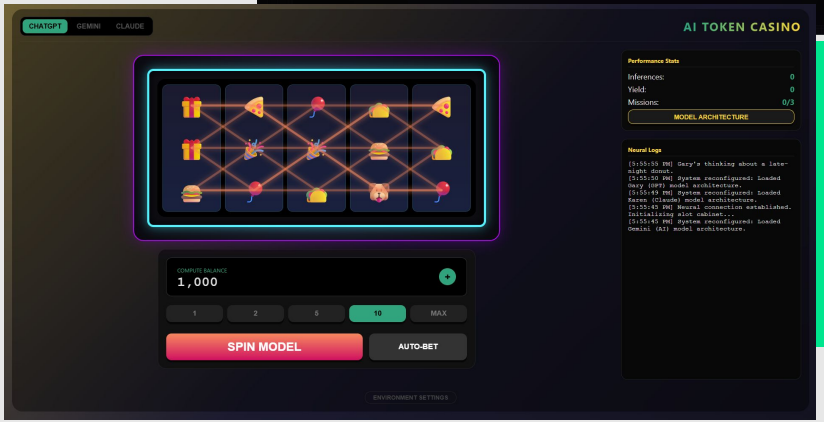
It. 3-6: Theme and Experience Design

Added thematic emojis and log, SFX, visual animations, gradient background

AI was useful for interpreting abstract “AI-themed casino” concept

Development
Continued





It. 7: Persona-Based Expansion

Began implementing personas and user stories as features

Expanded game into 3 modes with varying difficulties and themes

It. 8-23: Advanced Feature Expansion

Added new popups, styling, spin speeds, more reels and paylines, missions, settings and customization

Weaknesses of AI: old bugs came back as more new features were added

Iteration Log Findings

Progression and Regression

Most changes led to some kind of progress

Some bugs would be fixed, but reintroduced by later prompts, most often in the UI

Prompt Specificity

AI performed better when the prompt was very specific

Better at handling focused tasks: fixing one bug, changing one style, adjusting one value

Manual Review Still Necessary

AI performed well in most cases, but made occasional syntax errors

Good at feature expansion, weaker at long-term structural consistency

AI in Software Engineering

Pros

- Fast Prototyping
- Rapid Iteration
- Creative Theme and UX Ideas
- Assists With Code Upkeep

Cons

- Regression Risk
- Needs Precise Prompting
- Unreliable
- Needs Manual Testing

Lessons Learned

- Start with small scope and build outward
- Keep prompts specific
- Re-test old features after every change
- Use AI for both creation and revision
